

Elements of Automated Storage Systems: Vertical Carousels & Horizontal Carousels

Automated vertical carousel storage systems, as the name implies, are automated systems that efficiently protect and store goods in a compact pattern. They provide users with the ability to access and retrieve things whenever they require them. To fulfil fluctuating demands, this piece of technology can manage a variety of volumes and types of stocks at varying speeds.

Vertical carousel storage systems are often found in manufacturing enterprises, industries, warehouses, and distribution centres. They are the most dependable alternative to traditional storage and shelf systems. Automated storage systems save valuable floor space and improve safety, allowing you to expand output. Vertical lift modules are a type of automated storage system and one of the most promising warehouse technologies.

Automated Storage Systems: Analysis

The automated storage and vertical carousel systems can be split down into seven primary technologies that can help a distribution centre to store and safeguard products. Each mechanism has been described in detail below for your convenience.

- **Automated Vertical Carousels**

They are a set of mechanical carriers that travel in a vertical loop in a fixed track in a bi-directional loop. [Automated vertical carousels](#) transfer stored inventory to an ergonomically located distribution counter quickly and safely. They work under the direction of an operator.

- **Horizontal Carousels**

This is a set of dense storage bins that revolves around an oval track. They travel horizontally to the distribution stations on the instruction of the operators to fulfil the order requirements, as the name implies.

- **Vertical Storage Systems/Vertical Lift Modules**

A bunch of columns of trays, as well as an extractor in the centre, make up these enclosed automated vertical carousel systems. When delivering trays of stored and sealed products to an operator, this feature comes in handy.

- **Crane operated Mini Load ASRS (Automated Storage and Retrieval Systems)**

The Mini Load AS (Automated Storage) system consists of a single crane-mounted load handling device that is ideal for extremely dense storage. Heavy-duty machinery, Mini Load AS can handle cases, boxes, and trays.

- **VBM (Vertical Buffer Modules)**

Vertical buffer modules are a low-cost load-handling solution. They consist of an enclosed shelving system with a central moving mast. Effective at storing, retrieving, and delivering loads to their designated picking sites. VBMs can be programmed to deliver them to an outbound conveyor automatically for faster operations.

- **Robotic/Mechanical Shuttles**

Robotic shuttles are automated storage systems that transport things quickly to people and provide excellent product management and workflow results. This mechanical device is an excellent addition to warehouses and facilities for handling cases and trays.

- **Floor Robots**

This is a squadron of self-contained, mobile robots that store things efficiently on movable storage and shelving systems. It then moves the shelves from one storage location to another or to the picking bays as needed.

That's A Wrap!

Production and assembly businesses benefit greatly from [automated storage solutions](#). Hospitals, government agencies, and administration offices can all benefit from having such storage systems on their premises. Whether you need a simple storage solution or a more accurate system for your warehouse or facility, the automated systems on this list will undoubtedly fulfil your needs.

Incorporating a dynamic vertical lift module and goods-to-person storage systems into your operation will help you save valuable floor space while increasing productivity and picking accuracy. This can aid inventory control and personnel ergonomics in your industrial facility or warehouse.
